TITLE: Disturbance insensitivity of amplitude criterias of phase correlation of seismic waves

SOURCE: Geologiya i geofizika, no. 4, 1966, 107-119

TOPIC TAGS: seismic wave, signal correlation, correlation statistics

ABSTRACT: In continuation of a number of papers published in Geologiya i geofizika in 1964 and 1965 dealing with the separation of signals (seismic waves) from the background noise, the author discusses formal criteria (in contrast to visual inspection) of phase correlation. The suggested methods are a part of a larger program of optimal methods of treatment of information contained in the seismic record. This particular approach is an analysis of the maxima and their phase correlation and is based on probability considerations. The symbols, terminology, and the assumptions concerning the type of signal and the disturbance are the same as used in the author's paper in Geologiya i geofizika No 5 (1965). Orig. art. has: 4 figures and 24 equations.

AUTHOR: Col'din, S. V.⁴⁴

TITLE: Using amplitude factors for phase correlation of seismic waves

SOURCE: Geologiya i geofizika, no. 5, 1965, 65-79

TOPIC TAGS: seismology⁴⁴, geophysics

ABSTRACT: A number of criteria are used in correlation of seismic waves. Among these the amplitude factor based on the tracing of amplitude maxima, is one of the most important. If this criterion leads to a different correlation than others (e.g. the index of phase matching), then it is necessary to estimate the probability of error for the amplitude factor. In using amplitude criteria, a transition is possible from phase to phase due to change in amplitude relationships between signal maxima caused by interference. This phenomenon is called amplitude inversion. It is shown that the probability of amplitude inversion depends not only on interference dispersion and the relationship of the signal amplitudes, but also on the band occupied by the energy spectrum of the interference. Inversions are more probable for

Card 1/2

L 62544-65

2

wider interference energy spectra. In selecting the variant of correlation in a set of permissible axes, the concept of amplitude domination for the axes is introduced. It is shown that domination "on the average" is less subject to interference than "weak" domination. The equations obtained are used for the determination of the probability of different variants of correlation. Orig. art. has: 57 formulas, 4 figures.

TITLE: Interference-free character of the complex form of seismic waves

SOURCE: Geologiya i geofizika, no. 11, 1965, 127-131

12

TOPIC TAGS: seismic wave, shock wave analysis

ABSTRACT: The complex form of seismic waves usually occurs due to the interference by two simple waves and is one of the most important features taken into account in phase correlation in the interference zones. It is important that the interpreter know the probability of the relation between such complications and the superposition of random noises and the probability that the random noises do not distort the existing complication in reality. To solve these problems the present author mathematically examines the stability of the complex forms of seismic waves, severe complication arising upon interference, a simple quasi-sine wave, narrow-band noise, and the characteristics of weak complication. The

Card 1/2

UDC: 550.834

ACC NR: AP6010826

analysis shows that complication of the recording associated with interference of simple waves is a comparatively interference-free feature which can serve for tracing and distinguishing waves in the interference zones. Orig. art. has: 2 figures and 21 formulas.

TITLE: Displacement of zero-crossings and maxima of seismic signals affected by noise

SOURCE: Geologiya i geofizika, no. 10, 1964, 130-144

TOPIC TAGS: seismology, seismologic instrument, signal processing

52
46
B

ABSTRACT: A method is developed for determining the displacement of zero-crossings and maxima of seismic signals in noise. The noise is assumed to be stationary and gaussian and the signal is either approximated by a stationary gaussian process, or is entirely determined. This problem arises in using multi-channel recordings to determine depths to reflecting or refracting horizons by phase correlation methods and also in evaluating the usefulness of the phase correlation method itself. The development is carried out for both zero-crossings and maxima, since there is some question of the comparative stability of the two when used in correlation. The study treats first the displacement of zeroes and maxima of a signal on a single trace; this is extended to the correlation of one trace with another, and finally to the general case of an arbitrary number of traces. It is shown that the displacement of both the zeroes and

Card 1/2

L 10094-66

ACC NR: AP5004152

maxima is a local feature of the signal and noise functions, depending on the values of these functions over a short interval of change of the argument. From a consideration of the ratio of frequencies of the noise and signal, it is concluded that the displacement of maxima is stronger than the displacement of noise. In the case of a sinusoidal signal, an increase in frequency always leads to an increase in displacement of maxima in comparison with zeroes. For this reason, the use of maxima in correlation is justified in most cases. The author also considers the case of high-frequency noise and strong noise. In the latter case, both signal and noise are considered to be quasi-sinusoidal functions of equal frequency. In conclusion the author expresses his deep gratitude to Dr. of Technical Sciences N. N. Puzinov, and to Dr. of Physico-Mathematical Sciences F. M. Golitzman, for their help in the study and for evaluating the results. Orig. art. has: 68 formulas.

TITLE: Interference insensitivity of time criteria of the phase
correlation of seismic waves

SOURCE: Geologiya i geofizika, no. 9, 1966, 103-115

TOPIC TAGS: seismic wave, signal correlation, correlation statistics

ABSTRACT: In this article the author continues to develop methods for separation of seismic wave signals from random background interference. In several previous articles he discussed the optimal (probabilistic) treatment of information contained in the seismic record. In an earlier article (Geologiya i geofizika, no. 4, 1966) he developed amplitude criteria for interference insensitivity, and in the present article he develops time criteria and compares them with the amplitude criteria. It follows from analysis that the latter are much more reliable than the former (which are based on the displacement of the extremum from a fixed moment of time) in a single channel. However, with an

Card 1/2

UDC: 550.834

ACC NR: AP7001833

increase in the number of channels (if the apparent velocity of the waves is known), the interference stability of the time criteria increases rapidly and for $n \geq 6$ exceeds that of the amplitude criteria. If the time of arrival of the signals fluctuates because of surface nonuniformity, the interference insensitivity of the time criteria rapidly decreases, and the latter become useless when the mean fluctuation is about one-fifth of the period. A combination of both types of criteria might be useful for analysis of several waves appearing in the same seismogram. Orig. art. has: 5 figures and 26 formulas.

TEXT: A universal apparatus is described for simulating chemical radiation apparatuses, and for conducting research with a Co⁶⁰ γ -radiation source of activity 60 000 μ -equiv. of radium. This design of apparatus enables a powerful source of radiation to be assembled safely using a special container for transportation and charging. This apparatus can be used for simulating chemical radiation apparatus with powerful isotopic sources of γ -radiation, and of various shapes and dimensions.

POLISH: Radiation chemical operator of gas-oil from Kuznetsk petroleum

RE 1. TITLE: Investigation of radiation cracking of kerosene. Report No. 11.

TEXT: The effect of gamma radiation on the cracking of kerosene, F. 3, P. 1, K-180, from Kuznetsk petroleum, has been studied. For the experiments a reactor unit, K-180-3 (Kobalt-3), was used, and the dose was maintained constant at 100 rads.; the temperatures were 400 and 450°C, the maximum pressure 100 atm, and the experiment took 14 hr. It was established that the K-180 unit intensifies the cracking process considerably, and that the kerosene converted twice as rapidly as in thermal cracking. The yield of the lightest fraction, i.e. 2-3 sec., exceeds that of all other fractions *X* four times at 1.5 Mr up until it reaches 50 to 55% of the feed at a dose of 5 Mr. However, the olefin content of this fraction is lower than that of the corresponding fraction in thermal cracking. There are 6 figures and 1 table.

TITLE: Studies in radiation polymerization, 2. The radiation polymerization of piperylene

SOURCE: Vysokomolekulyarnye soyedineniya, v. 5, no. b, 1963, 1255-1262

TOPIC TAGS: radiation polymerization, piperylene, radiolysis, Co⁶⁰, carbon tetrachloride, argon, krypton

ABSTRACT: Samples of piperylene monomer were placed in sealed glass ampules in an atmosphere of nitrogen, argon, or krypton, and subjected to gamma-irradiation by means of a Co⁶⁰ installation. Following absorption of doses from 1 to 160 Mr, the ampules were opened, the gases subjected to chromatographic study. The obtained polymer was analyzed for viscosity and degree of unsaturation, and was studied by infrared spectroscopy. The gaseous products of radiolysis contained hydrogen, methane, ethylene, acetylene, divinyl and 98.5% piperylene. The degree of unsaturation of the polymer amounted to 84 and 87% for samples receiving 80 and 160 Mr respectively. It was found that the yield of the polymer increased with the

Card 1/2

ACCESSION NR: AP3004711

2

irradiation dose and that the presence of nitrogen, argon, and krypton exerted a sensitizing effect on radiation polymerization. Infrared spectroscopy revealed that the structure of the polypiperylene consisted mainly of 1,4-trans chains, 1,2-trans chains, or of their combination, while the amount of cis-configurations had decreased trifold. It is concluded that in radiolysis the main line of cleavage of the piperylene molecule consists in the severance of the single bond between the fourth and fifth carbon atoms. The authors are deeply grateful to N. I. Leonova for assistance in infrared spectroscopy. Orig. art. has: 1 table, 2 charts, and 14 formulas.

TITLE: Radiation polymerization of ethylene in enlarged laboratory apparatus.

JOURNAL: Plasticheskiye massy*, no. 2, 1964, 3-6

TOPIC TAGS: ethylene, radiation polymerization, reactor design, reactor surface area, reaction rate, polymer yield, reactor temperature field

ABSTRACT: Radiation polymerization of ethylene was conducted in laboratory reactors of 1-2 liter capacity (fig. 1 & 2). Based on tolerances admitted in this work, it was found that the temperature field can be calculated with sufficient accuracy. Comparison of reaction rates and yield of ethylene polymer shows that these factors are independent of the specific surface of the reaction space. Thus

SOURCE: Byulleten' izobretens i tovornykh znakov, no. 21, 1965, 48

TOPIC TAGS: polymer, copolymerization, graft copolymer, radiation polymerization, imide, maleic acid

ABSTRACT: This Author Certificate presents a method for obtaining graft copolymers on the basis of poly-organosiloxanes by the interaction of ionizing radiation with a polyorganosiloxane powder in the presence of modifying additives. To improve the physicochemical properties of the graft copolymers and their thermal stability and solvent stability, imides, e.g., N-substituted imides of maleic acid, are used as modifying additives. The radiation dosage is 0.3--8 Mrad and the intensity of radiation is 0.05--0.7 Mrad per hour.

TITLE: Decomposition of pure hydrocarbons during electroerosive machining using a dynamoelectric pulse generator

SOURCE: Moscow. Eksperimental'nyy nauchno-issledovatel'skiy institut metallorezhushchikh stankov. Khimicheskiye reaktsii organicheskikh produktov v elektricheskikh razryadakh (Chemical reactions of organic products in electric discharges), Moscow, Izd-vo Nauka, 1966, 164-172

TOPIC TAGS: electroerosion, alkane, aromatic hydrocarbon, cyclohexane

ABSTRACT: The effect of various types of hydrocarbons used as interelectrode media (n-heptane, n-octane, n-decane, tetradecane, cyclohexane, benzene, o-xylene, tetralin) on the chemical reactions taking place during electroerosive machining was studied under conditions approximating those prevailing in the operation of making holes ($d = 20$ mm) in steel parts. The power source was an MIG-2B dynamoelectric generator with a pulse repetition frequency of 600 cycles. The physicochemical properties of the pure hydrocarbons were found to have a considerable effect on the characteristics of the process of electroerosive machining of the metal. Empirical equations are derived

Card 1/2

ACC NR: AT7006847

for the decomposition of the hydrocarbons. Thermodynamic calculations and results of oscillographic analysis showed that the energy expended on the chemical processes varies widely and amounts to 5.52-27.92% of the total energy of the pulse for paraffins and cyclohexane, 1.73-6.52% for benzene and o-ylene, and 10.02-11.36% for tetralin. The erosion of the anode and the total electrode wear increase in the series: cyclohexane, paraffin hydrocarbons, aromatic hydrocarbons. Orig. art. has: 1 figure, 6 tables and 1 formula.

TITLE: Fusibility in binary systems which are formed from tungsten hexachloride and molybdenum pentachloride with the chlorides of aluminum and iron

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 6, no. 7, 1961 *642 - 1644

TEXT: Owing to the high vapor tensions occurring in chlorides and oxychlorides of tungsten and molybdenum at the chlorination temperature, they are well suited for removing admixtures from the minerals. Since they contain, however, iron- and aluminum chloride impurities the authors studied the reaction of tungsten hexachloride and molybdenum chloride with aluminum and iron chlorides. This is of importance not only for the joint condensation of the chlorides, but also for the application of metallic W and Mo coatings by reduction from the gaseous chlorides. WCl_6 and $MoCl_5$ are produced according to Ref. 9(Rukovodstvo po preparativnoy neorganicheskoy khimii pod red. G. Brauera I. L. II., 1956) Melting temperatures:

Card 1/7

B'10/B202

Fusibility in binary systems...

$\text{WCl}_6 = 275^{\circ}\text{C}$; $\text{MoCl}_5 = 194^{\circ}\text{C}$; $\text{AlCl}_3 = 194^{\circ}\text{C}$; $\text{FeCl}_3 = 302^{\circ}\text{C}$. The cooling curves were recorded by means of a Kurnakovskiy thermometer, the temperatures were measured by means of a Cr-Al thermocouple. Melting was done in Stepanov vessels which, after displacing the air by means of chlorine had been sealed and placed into the furnace. Owing to the chlorine atmosphere the thermal dissociation of WCl_6 and MoCl_5 was reduced. The portions added weighed 4-5%, the cooling rate was $4-5^{\circ}\text{C}/\text{min}$. As is shown in Fig. 1 a eutectic is formed in the system WCl_6 - AlCl_3 at 36% by weight AlCl_3 , and a melting temperature of $168 \pm 2^{\circ}\text{C}$. The points characterize the polymorphous transformation of WCl_6 at $220 - 174^{\circ}\text{C}$. In the concentration range $\text{WCl}_6 = 100 - 52\%$ primarily $\beta\text{-WCl}_6$ -, between $52 - 62\%$, $\beta\text{-WCl}_6$ - and between $62 - 54\%$, $\alpha\text{-WCl}_6$ crystal are separated. At a lower WCl_6 content AlCl_3 crystallizes primarily on undercooling of the melts which is also characteristic of AlCl_3 . A tendency to undercooling is observed also in the eutectic. Melts with WCl_6 and MoCl_5 are dark brown. AlCl_3 crystallization

Card 2/7

Fusibility in binary systems...

has a low thermal effect. In the $\text{WCl}_6 - \text{FeCl}_3$ system (Fig. 2), the eutectic is at 4.5% by weight Fe and at $224 \pm 2^\circ\text{C}$. The effects of the $\gamma\text{-WCl}_6 \rightleftharpoons \alpha\text{-WCl}_6$ transition at 222°C could not be observed due to the superposition of crystallization effect of the eutectic. The effects of the transition of $\beta\text{-WCl}_6 \rightleftharpoons \alpha\text{-WCl}_6$ at 222°C were observed in a wide concentration range. The eutectic of $\text{MoCl}_5 - \text{AlCl}_3$ (Fig. 3) is at 44% by weight Al and at $121 \pm 2^\circ\text{C}$. AlCl_3 crystallization takes place on undercooling of the system. In the $\text{MoCl}_5 - \text{FeCl}_3$ (Fig. 4), the eutectic is at 37% by weight and at $88 \pm 2^\circ\text{C}$. There are 4 figures and 10 Soviet-bloc references.

TITLE: Refining of tungsten hexachloride and molybdenum pentachloride from admixtures of iron and aluminum chlorides

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Tsvetnaya metallurgiya,
no. 1, 1962, 101 - 106

TEXT: For the purpose of simplifying the technology of chlorination methods in the reprocessing of tungsten and molybdenum-containing materials, tests were performed to refine gaseous WCl_6 and $MoCl_5$ from iron and aluminum chlorides. The methods of fusibility and tensometry were used to study the interaction of components in the WCl_6-NaCl , WCl_6-KCl , $MoCl_5-NaCl$, $MoCl_5-KCl$ systems. The absence of a chemical interaction in the aforementioned systems on the one hand, and the possibility of formation of low-volatile compounds $Na(K)FeCl_4$ and $Na(K)AlCl_4$ on the other hand, was taken as a basis to develop a method of refining tungsten and molybdenum chlorides from $FeCl_3$ and $AlCl_3$ with the aid of alkali metals. The refining of WCl_6 and $MoCl_5$ was performed in a 40-mm diameter column filled with NaCl or KCl lumps (Figure 3). The refining conditions were estab-

AUTHOR: Gol'din, V.Ya.

TITLE: Characteristic Difference Scheme for Nonstationary Kinetic Equation

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 4, pp. 749-751

TEXT: For a nonstationary work of a reactor, the density of the number of neutrons $\Psi(P, \bar{e}, v, t)$ is a function of the point P in the reactor, the unit vector \bar{e} of the velocity, the velocity v of the neutrons, and the time t. The function Ψ satisfies the linear (kinetic) integro-differential equation of Boltzmann. The author considers approximatively the case of an isotropic scattering with $v = 1$ so that the mentioned equation appears in the form

$$(1) \quad \frac{\partial \Psi}{\partial t} + \frac{\partial \Psi}{\partial \bar{e}} + a \Psi - Bn = q(P, \bar{e}, t)$$

where n is the mean density of the number of neutrons, c is the density of the sources of neutrons and a, B are coefficients. The author proposes a method for the construction of the characteristic difference schemes for (1), where the solution of the obtained system of equations is simplified

TITLE: Quasidiffusion method for solving the kinetic equation

SOURCE: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 4, no. 6,
1964, 1078-1087

TOPIC TAGS: kinetic equation, diffusion, Boltzmann equation, neutron flux

ABSTRACT: The author treats the Boltzmann linear integro-differential equation

$$\frac{1}{v} \frac{\partial \varphi}{\partial t} + \Omega \nabla \varphi + \Sigma \varphi = \int \varphi(r, \Omega', v', t) w(\mu_0, v' \rightarrow v) dv' d\Omega' + s(r, \Omega, v, t) \quad (1)$$

subject to the condition that the exterior surface S is convex and the neutron flow onto S from the outside is equal to zero. By a series of transformations, this problem is converted to a generalization of that of solving the diffusion problem. These can be handled by any one of a number of standard methods. The quasidiffusion method proposed here makes it possible to decrease significantly the number of iterations of the whole equation, transferring a large part of the work in defining the critical parameters to a system of equations of the diffusion type. Two

Card 1/2

L 19001-65

ACCESSION NR: AP5001457

examples are given to illustrate convergence of the iterative method in the case of an inhomogeneous diffusion equation; the author gives results of computing neutron flow in a system which is a homogeneous sphere of radius R_1 (1-st zone) surrounded by a homogeneous spherical shell, of thickness $R_2 - R_1$ (2-nd zone), with

parameters

$$\alpha^{(0)} = 0.6045, \quad \alpha^{(1)} = 0.6888$$

$$\beta^{(0)} = 0.4351, \quad \beta^{(1)} = 0.6888$$

$$R_1 = 7 \text{ cm}, \quad R_2 = 14 \text{ cm}.$$

TITLE: Nonlinear difference schemes for hyperbolic equations

SOURCE: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 5, no. 5, 1965, 938-944

TOPIC TAGS: hyperbolic equation, computer technology

ABSTRACT: In solving multidimensional problems, the limitation of the memory speed of even and most advanced computers allowed only the use of rough networks. The degree of accuracy of first-order schemes was thus insufficient and it was desirable to consider schemes of a higher degree of accuracy. However, with rough networks even these schemes did not yield the qualitative aspect of the solution. A method for constructing nonlinear (even for linear problems) schemes was suggested which preserved the qualitative behavior of the schemes of the first order which, however, had a higher degree of accuracy. The authors thank A. N. Tikhonov and A. A. Samarskiy for consultation and G. V. Danilov.

TITLE: Media for precision electroerosion machining of metals

SOURCE: Elektronnaya obrabotka materialov, no. 1, 1965, 20-36

TOPIC TAGS: electroerosion machining, metal machining

ABSTRACT: An experimental investigation of the effect of various interelectrode media on the process of electroerosion machining (EEM) of steels is described. Paraffin, naphthene, and aromatic hydrocarbons, mono-, di-, and tri-atomic alcohols, polyethyl-siloxanes (No. 3 and No. 5 silicones), kerosine, Estonian shale resin, and green soap were tested. It was found that the electrode erosion and wear depend on the medium and the power-supply source used. The best results were obtained with No. 3 silicone and tetralin used with longer pulses; the specific erosion increased with the discharge energy which enhanced the power efficiency of the

process. Structural and stainless steel cutting was tested with these inorganic liquids as interelectrode media: oil-water emulsion, kaolin suspension in water, same with NaCl and $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$, solution of NaCl, solution of NaCl and $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$, solution of NaCl and KOH, soluble glass, and water. The best results were obtained with the NaCl-and- FeCl_3 solution: the electroerosion process combined with the electrochemical ensured a very clean cut surface and high efficiency. Detailed laboratory data is tabulated. Orig. art. has: 7 figures, 4 formulas, and 11 tables.

2053. Gol'din, E. M., Motion of viscous fluids in the gap between two parallel plates of a separator (in Russian), *Tekhnicheskii Zhurnal. Sistemnye issledovaniya i voprosy tekhniki*, No. 1, Nauk SSSR 15, 137-140, 1963.

Chemical and food industries utilize to a great extent the method of mixture separation by centrifugal forces acting on the fluid with the aid of interplates. The viscous fluid in a separator moves in a thin layer under a centrifugal force. Utilizing the smallness of the gap of the interplates, we can ascertain velocity components of the fluid as polynomials of the second degree in a quantity relating to the gap. The external forces consist of centrifugal

S.M. Gotoh

trifugal and Coriolis forces and can be expressed as functions of angular velocity of the axis of the separator, and velocity components of the fluid. On upper and lower inter-plate the velocity components must be zero. Hence the first terms in the above polynomials vanish. Substituting them into the equations of continuity and motion, we can find velocity component.

If Q be the capacity of separator, mean values of velocity components in radial and longitudinal direction v_r^* , v_z^* are given by

$$v_r^* = Q/(2\pi h \sin \alpha \rho); v_z^* = -Q/(12\pi r \rho)$$

where h is the width of slit, ρ kinematic coefficient of viscosity, and α the inclination of lower inter-plate to the axis of separator.

An example for a milk separator is given and proper values are obtained.

St. Nauch. Rabot Znaniagr. Tekhnol. In-ta Kholodil'noy Prom-sti, Vol. 6, 1954, No. II

The author transforms the original differential equation of motion (of a machine consisting of a compressor with a flywheel), which defines the unknown angle of oscillation of the rotor, into a second order differential equation whose coefficients are known functions of the period. He derives periodic solutions of this latter equation and investigates their stability. (ZEMAL, No. 4, 1955)

PERIODICAL: Sb. tr. obshchekhn. katedr. Leningr. tekhnol. in-ta, kholodil'naya prom-sti, 1956, Vol 12, pp 72-90

ABSTRACT: A study is made of two-dimensional, stationary flows of an ideal incompressible fluid in rectangular confinements. The well-known method of conformal representation with the aid of Jacobi's elliptical function is used. Some considerations formed on the basis of the investigations performed are advanced relative to the character of possible actual flows in rectangular reservoirs.
